Reflection:

I was very nervous to start this module as I still had so much to learn and understand about data science. I was still unsure of a lot of things and needed more practice and to work more on it. So throughout this module I did gain more insight into a few things but did really struggle with some. In unit 1 the introduction to machine learning lecture cast helped me understand some simple facts about machine learning. This was an easy start to get me into the module and start learning the information I needed, I felt a little bit more at ease after this lecture cast. In unit 1 I had to have a discussion on the 4.0 fourth industrial revolution, I had to identify an incident and discuss failures, implications, economic costs and more. This was the first time I had heard of this revolution so it was interesting to try and find an incident to research and discuss. I found this interesting and it was very useful to write about. During unit 3 lecture cast I learned about correlation and regression, and predicting the dependent variable, and negative or positive correlation. This was interesting to learn, I didn't know about this before and definitely wanted to understand more. It did stress me out a little bit when I started the lecture cast but after some explanation it started to make sense. After the correlation and regression lecture cast there was a an activity where I had to run different programmes and change variables to be able to observe how the changes in data points impact the correlation and regression. This was very hard to get my head around, I am still very unsure with coding and this was hard to understand, I also didn't understand the purpose of doing this, I found understanding why specific tasks like this incorporate into the data science role. After completing this task I still feel a bit unsure on it but I do feel more confident in being able to do it if I was to do it again. Unit 5 lecture cast was about clustering, there lecture casts throughout this module were interesting and taught me a lot, it was overwhelming taking in all the information without actually putting anything into practice as I do struggle to learn this way so a lot of it went right over my head. I had to go over it a couple of times and then answer the questions. It did take me a few tries to get the answers right. I feel better about it now after continuing the learning throughout the module and learning more to put it all into practice. Also in unit 5 was a jaccard coefficient calculation task, this was a fun task and quite interesting to do, I found it easy to do once I understood how and felt confident in doing it. Unit 6 consisted of an analytical report, I worked with a few other student in a group to create a project report on pricing of airbnb's. It went through the EDA process, so it taught me a lot of each step of the EDA process. Then we went through ML modelling, and drew a conclusion, working as a team throughout this had some difficulties as time difference played a role, so meeting to discuss work was hard, trying to split the work evenly was difficult so we had set tasks but then because I didn't participate in a certain task it was hard to understand the whole report. Overall I found this interesting and learned a lot but doing it as a team restricted what I learnt throughout it. Unit 7 lecture cast was learning about the artificial neural network, this was very useful for my last assignment of this module and taught me some of the information I needed to complete my last assignment, this was interesting to learn and develop my skills ahead of my assignment. Unit 7 also consisted of perceptron activities, I used python to complete the tasks in this activity. As my degree has gone on and I have done more modules, learning python and coding has become easier to understand so this task was good to keep up my knowledge of python. Unit 8 lecture cast was about back propagation in artificial neural networks, this was abit confusing to understand, unit 8 also consisted of a discussion of risks and benefits of using AI writers, this was interesting to research and read all the different risks and benefits of it and conclude if it is beneficial or not. Unit 9 lecture cast was about convolutional neural networks, this again was interesting to learn about all the different types of networks involved throughout data science, and after some understanding it was easier to understand. Unit 9 had a CNN model activity so after the lecture cast it made this tasks more under stable, this was very hard to get my head around, it was very confusing and I could not figure it out, this task is going to need more research and time spent on it for me to understand. It has made me struggle and stress me out, hopefully after spending more time on it I might be able to get to grips with it. Unit 11 lecture cast was about model selection and evaluation this was easy to understand and quite interesting especially the questions about type errors in cancer as I find healthcare interesting. Unit 11 had a model performance measurement activity, I had to change different parameters and observe the

impact, this took a while to get my head around, I think I struggle to get the understanding of coding to begin with but when I get it, its then easier to understand. Unit 11 had the assignment of making a presentation on neural network models so unit 7 lecture cast definitely helped me out here. This was easy to research and explain what a neural network is but understand the modelling process was a little bit confusing and took a while to understand. Unit 12 consisted of the last assignment of creating my portfolio, I do struggle abit with GitHub to understand how to organise my work on it, but after some research and YouTube videos to help I managed to get together a nice page. It makes me happy to see all my hard work in one place and presented nicely.
